Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter

This standard is issued under the fixed designation D 3035; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers polyethylene (PE) pipe made in thermoplastic pipe dimension ratios based on outside diameter and pressure rated for water (see Appendix X1). Included are criteria for classifying PE plastic pipe materials and PE plastic pipe, a system of nomenclature for PE plastic pipe, and requirements and test methods for materials, workmanship, dimensions, sustained pressure, burst pressure, and environmental stress cracking. Methods of marking are also given.

1.2 All pipes produced under this specification may be used for the transport of water, industrial process liquids, effluents, slurries, municipal sewage, etc. The user should consult the manufacturer to determine whether the material being transported is compatible with polyethylene pipe and will not affect the service life beyond limits acceptable to the user.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.4 The following safety hazards caveat pertains only to the test methods portion, Section 7, of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology

3.1 Definitions—Definitions are in accordance with Terminology F 412, and abbreviations are in accordance with Terminology D 1600, unless otherwise specified.
3.2 Definitions of Terms Specific to This Standard:

3.2.1 hydrostatic design stress— the estimated maximum tensile stress in the wall of the pipe in the circumferential orientation due to internal hydrostatic water pressure that can be applied continuously with a high degree of certainty that failure of the pipe will not occur.

3.2.2 pressure rating (PR)—the estimated maximum pressure that water in the pipe can exert continuously with a high degree of certainty that failure of the pipe will not occur.

3.2.3 relation between dimension ratio, hydrostatic design stress, and pressure rating—the following expression, commonly known as the ISO equation, is used in this specification to relate dimension ratio, hydrostatic design stress, and pressure rating:

\[ \frac{2S}{P} = R - 1 \text{ or } \frac{2S}{P} = (D_0/t) - 1 \quad (1) \]

where:

- \( S \) = hydrostatic design stress, psi (MPa),
- \( P \) = pressure rating, psi (MPa),
- \( D_0 \) = average outside diameter, in. (mm),
- \( t \) = minimum wall thickness, in. (mm), and,
- \( R \) = thermoplastic pipe dimension ratio (\( D_0/t \) for PE pipe).

3.2.4 thermoplastic pipe dimension ratio (DR)—the ratio of pipe diameter to wall thickness. For PE pipe covered by this specification it is calculated by dividing the average outside diameter of the pipe, in inches, by the minimum wall thickness, in inches. If the wall thickness calculated by this formula is less than 0.062 in. (1.6 mm), it shall be arbitrarily increased to 0.062 in.

3.2.5 thermoplastic pipe materials designation code—the polyethylene pipe materials designation code shall consist of the abbreviation PE for the type of plastics, followed by the ASTM grade in Arabic numerals and the hydrostatic design stress in units of 100 psi with any decimal figures dropped. Where the hydrostatic design stress code contains less than two figures, a zero shall be used before the number. Thus, a complete material code shall consist of two letters and four figures for PE plastic pipe materials (see Section 5).

4. Pipe Classification

4.1 General—This specification covers PE pipe made from three PE plastic pipe materials in various dimension ratios and water pressure ratings.

4.2 Thermoplastic Pipe Dimension Ratios (DR)—This specification covers PE pipe in various dimension ratios such as, but not limited to, DR 11, DR 13.5, DR 17, and DR 21. The pressure rating is uniform for all nominal sizes of pipe for a given PE pipe material and DR. (See Table X1.1.)

4.3 Special Sizes—Where existing system conditions or special local requirements make other diameters or dimension ratios necessary, other sizes or dimension ratios, or both, shall be acceptable in engineered products when mutually agreed upon by the customer and manufacturer if (1) the pipe is manufactured from plastic compounds meeting the material requirements of this specification and (2) the strength and design requirements are calculated on the same basis as those used in this specification.

5. Materials

5.1 Classification—Polyethylene compounds suitable for use in the manufacture of pipe under this specification shall be classified in accordance with Specification D 3350 and as shown in Table 1.

NOTE: 1—Piping intended for use in the transport of potable water should be evaluated and certified as safe for this purpose by a testing agency acceptable to the local health authority. The evaluation should be...
in accordance with requirements for chemical extraction, taste, and odor, in accordance with requirements for chemical extraction, taste, and odor, in accordance with requirements for chemical extraction, taste, and odor, in accordance with requirements for chemical extraction, taste, and odor

---

*The minimum is the lowest wall thickness of the pipe allowable at any cross section. The maximum permitted wall thickness, at any cross section, is the minimum wall thickness plus the stated tolerance. All tolerances are on the plus side of the minimum requirement.

---

5.3 Rework Material—Clean, rework material having the same classification and generated from the manufacturer’s own pipe production, may be used by the same manufacturer, as long as the pipe produced meets all of the requirements of this specification.

6. Requirements

6.1 Workmanship—The pipe shall be homogeneous throughout and free from visible cracks, holes, foreign inclusions, or other defects. The pipe shall be as uniform in color, opacity, density, and other physical properties.

6.2 Dimensions and Tolerances:
6.2.1 **Outside Diameters**—The outside diameters and tolerances shall be as shown in Table 3 when measured in accordance with Test Method D 2122. For diameters not shown in Table 3, the tolerances shall be the same percentage of the outside diameter as those for the closest listed diameter.

6.2.2 **Wall Thicknesses**—The wall thicknesses and tolerances shall be as shown in Table 4 when measured in accordance with Test Method D 2122. For wall thicknesses (DRs) not shown in Table 4, the tolerances shall be the same percentage of the calculated minimum wall as for the closest listed minimum wall thickness.

6.2.3 **Wall Thickness Range**—The wall thickness range shall be within 12% when measured in accordance with Test Method D 2122.

6.3 **Short-term Properties**—Specimens of pipe shall be tested in accordance with either Test Method D 1599 or Test Method D 2290. The test method used, Test Method D 1599 or Test Method D 2290, is determined by the pipe size and the availability of appropriate test equipment. Test Method D 1599 is generally used for 4 in. (114 mm) and smaller sizes and Test Method D 2290 for 2 in. (60 mm) and larger sizes. Short-term hoop stress and failure mode data is provided by either test.

6.3.1 **Burst Pressure**—The minimum burst pressure for PE plastic pipe shall be as given in Table 5, when determined in accordance with Test Method D 1599 and 7.6. Using a minimum fiber stress of 1250 psi (8.62 MPa) for PE 1404 and 2520 psi (17.37 MPa) for PE 2406 and PE 3408 when tested in accordance with Test Method D 2290, Procedure B and 7.7. The failure shall be ductile.

6.4 **Sustained Pressure at Ambient and Elevated Temperature**—At the pressures and temperatures specified in Table 7, pipes made from PE 1404 shall be tested in accordance with 7.4 and 7.5, pipes made from PE 2406, and PE 3408 shall be tested in accordance with 7.5. Tests may be conducted on any pipe size, but tests conducted on 6 in. (168 mm) nominal size pipe shall be considered representative of all pipe sizes. PE 2406 and PE 3408 shall be tested at either stress at 176°F (80°C). If ductile failures occur at the higher stress at 176°F (80°C), testing shall be repeated at the lower stress. Acceptable results are non-failure at the minimum average test time, or brittle failure at times exceeding the minimum average test time.

7. **Test Methods**

7.1 **Conditioning**—Condition the test specimens for not less than 46 h prior to test in accordance with Procedure A of Practice D 618, for those tests where conditioning is required.

7.2 **Test Conditions**—Conduct tests in the standard laboratory atmosphere of 73 ± 3.6°F (23 ± 2°C), unless otherwise specified in the test methods or in this specification.

7.3 **Sampling**—The selection of the sample or samples of pipe shall be as agreed upon by the purchaser and the seller. In case of no prior agreement, random samples as selected by the testing laboratory shall be deemed adequate.

7.4 **Ambient Temperature Sustained Pressure Test**—Select six specimens of pipe at random and test each specimen individually with water at controlled temperatures under the pressures given in Table 7. Each specimen shall be at least 10 in. (250 mm) or more than 3 ft (1000 mm) between end closures and containing the permanent marking on the pipe. Condition the specimens for at least 2 h at 73 ± 3.6°F (23 ± 2°C). Test for the minimum failure time specified in Table 7 in accordance with Test Method D 1598, at the pressure and temperature values given in Table 7. Maintain the specimens at the pressures indicated ±10 psi (±70 kPa) and the temperatures ±3.6°F (±2°C). Failure of two of the six specimens tested constitutes failure of the test. Failure of one of the six specimens tested is cause for retest of six additional specimens. Failure of one of six specimens tested in retest constitutes failure in the test. Failure of the pipe test specimen shall be as defined in Test Method D 1598.

7.5 **Elevated Temperature Sustained Pressure Test**—Prepare at least three test specimens as specified in 7.4. Using water as internal medium, test at 176°F (80°C) and at either hoop stress (S) specified in Table 7 for the given pipe material in accordance with Test Method D 1598. Two of three specimens must meet or exceed the specified minimum average failure time.

7.6 **Hydrostatic Burst Pressure**—The test equipment, procedures, and failure definitions shall be as specified in Test Method D 1599.

7.7 **Apparent Ring Tensile Strength at Yield**—The method and test equipment shall be as specified in Test Method D 2290, Procedure B. Test a minimum of five specimens.
8. Retest and Rejection

8.1 If the results of any test(s) do not meet the requirements of this specification, the test(s) may be conducted again in accordance with an agreement between the purchaser and the seller. There shall be no agreement to lower the minimum requirement of the specification by such means as omitting tests that are a part of the specification, substituting or modifying a test method, or by changing the specification limits. In retesting, the product requirements of this specification shall be met, and the test methods designated in the specification shall be followed. If, upon retest, failure occurs, the quantity of product represented by the test(s) does not meet the requirements of this specification.

9. Marking

9.1 Marking on the pipe shall include the following, spaced at intervals of not more than 5 ft (1.5 m):

9.1.1 Nominal pipe size (for example, 2 in. IPS),
9.1.2 Type of plastic pipe material in accordance with the designation code given in 3.2.5 (for example, PE 3408),
9.1.3 Thermoplastic pipe dimension ratio in accordance with 4.2 (for example, DR 11),
9.1.4 The pressure rating in pounds-force per square inch for water at 73°F (23°C) shown as the number followed by psi (kPa), for example, 100 psi or 690 kPa,
9.1.5 In accordance with 5.2, pipe that is intended to be suitable for use at 100°F (38°C) and below shall be marked, “100°F (38°C) max.”
9.1.6 “ASTM D 3035.”
9.1.7 Manufacturer’s name (or trademark) and code, and
9.1.8 Pipe intended for transporting potable water shall also include the seal of an accredited laboratory (see Note 1).

NOTE 4—Manufacturers using the seal of approval of an accredited laboratory must obtain prior authorization from the laboratory concerned.

9.2 Using Color to Identify Piping Service—It is not mandatory to use color to identify piping service, but when color is applied expressly to identify piping service, such as with stripes, a color shell or a solid color, blue is used for potable water; green is used for sewer; and purple (violet, lavender) is used for reclaimed water.

10. Quality Assurance

10.1 When the product is marked with this designation, D 3035, the manufacturer affirms that the product was manufactured, inspected, sampled, and tested in accordance with this specification and has been found to meet the requirements of this specification.
SUPPLEMENTARY REQUIREMENTS

POTABLE WATER REQUIREMENT

This requirement applies whenever a Regulatory Authority or user calls for product to be used to convey or to be in contact with potable water.

S1. Potable Water Requirement—Products intended for contact with potable water shall be evaluated, tested and certified for conformance with ANSI/NSF Standard No. 61 or the health effects portion of NSF Standard No. 14 by an acceptable certifying organization when required by the regulatory authority having jurisdiction.

X1.1 The pipe is rated for use with water at 73°F (23°C) at the maximum internal pressures shown in Table X1.1. Lower pressure ratings than those calculated in accordance with 3.2.3 may be recommended by the pipe manufacturer where unusually high pressure surges, elevated temperatures, or unusual installation conditions exist. Pressure ratings at 73°F (23°C) are generally suitable for use at service temperatures not exceeding 100°F (38°C). Pressure ratings are reduced at temperatures above 100°F (38°C), and materials having an elevated temperature HDB should be used when service at temperatures above 100°F (38°C) is anticipated. Consult the pipe manufacturer for information about elevated temperature service and pressure ratings. Industry experience indicates that satisfactory long-term service can be provided by PE plastic pipe meeting this specification that is properly installed and operated within the identified pressure and temperature ratings. The sustained pressure requirements (see 6.4) are related to these ratings through the slopes of the strength-time plots of these materials in pipe form.

X1.2 The hydrostatic design stress recommended by the Plastics Pipe Institute are based on tests made on pipe ranging in size from ½ to 3 in. (12.7 to 50.8 mm).
