BS 4875-1:2001

2001年7月2日

# Strength and stability of furniture

Part 1: Requirements for the strength and durability of the structure of domestic and contract seating

ICS 97.140

# Committees responsible for this British Standard

The preparation of this British Standard was entrusted to Technical Committee FW/2, Domestic and contract furniture, upon which the following bodies were represented:

Association of Building Engineers

Association of Manufacturers of Domestic Appliances

Association of Suppliers to the Furniture Industry Ltd.

British Coatings Federation Ltd.

British Contract Furnishing Association

British Furniture Manufacturers' Federation

British Laminated Plastics Fabricators Association Ltd.

British Plastics Federation

British Retail Consortium

British Shops and Stores Association (BSSA)

British Woodworking Federation

Castor Manufacturers' (UK) Association

Consumer Policy Committee of BSI

Co-opted Members

DTI (Consumer Safety Unit)

European Metal Sink Manufacturers' Association

Federation of the Electronics Industry

Flat Glass Manufacturers' Association

Furniture Industry Research Association (FIRA)

Glass and Glazing Federation

ICE Ergonomics

Kitchen Specialists Association

Leisure and Outdoor Furniture Association Ltd.

LHC Building Components and Services

Mail Order Traders' Association

National Bed Federation Ltd.

SATRA Technology Centre

Society of Glass Technology

Trading Standards Institute

This British Standard, having been prepared under the direction of the Sector Committee for Consumer Products and Services, was published under the authority of the Standards Committee and comes into effect on 15 August 2001

© BSI 07-2001

First published October 1972 Second edition September 1985 Third edition August 2001

## Foreword

This part of BS 4875 has been prepared by Technical Committee FW/2. It supersedes BS 4875-1:1985 and BS 4875-3:1985, which are withdrawn.

This revision of BS 4875-1 has been prompted by the publication of BS EN 1728:2001, which now contains the test methods previously included in BS 4875-1:1985 and BS 4875-3:1985. BS 4875-1:2001 consequently cross-refers to the test methods given in BS EN 1728:2001, although it retains a test method for flexibility and a drop test for single-seat units (which are not included in BS EN 1728:2001).

The performance requirements are verified by tests which reproduce normal use and common types of misuse to which seating can be subjected. They apply to a wide range of seating. Five test levels are given, corresponding to the variations in severity of end-use to be expected for various types of seating, e.g. delicate styles, short-life furniture, robust serviceable types. Whilst the tests reproduce normal use and common types of misuse, they do not reproduce any abuse to which the article may be subjected.

Annex A explains the test levels used in this standard.

The requirements apply only to the durability of the structure. They do not apply to the durability of filling materials, upholstery fabrics or foam cushions. The tests are designed to be applied to an article that is fully assembled and ready for use. The tests do not reproduce the effects of degradation of structural materials by sunlight or chemical attack.

A British Standard does not purport to include all the necessary provisions of a contract. Users of British Standards are responsible for their correct application.

Compliance with a British Standard does not of itself confer immunity from legal obligations.

#### Summary of pages

This document comprises a front cover, an inside front cover, pages i and ii pages 1 to 11 and a back cover.

The BSI copyright notice displayed in this document indicates when the document was last issued.

#### 1 Scope

This part of BS 4875 specifies performance requirements for the strength and durability of the structure of domestic and contract seating, including swivel/pedestal chairs intended for use in an office in the home, and pouffes and stools.

It does not apply to multiple seating units for stadium seating, seating intended for educational institutions and office work chairs.

It does not include requirements for the durability of upholstery materials or the durability of mechanisms as used in convertible sofa beds, nor for resistance to degradation by ageing of structural materials or upholstery materials. It does not include requirements for seat height adjustment and swivelling durability of pedestal seating.

- NOTE 1 Requirements for seat height adjustment and swivelling durability of pedestal seating are given in BS 5459-2:2000.
- NOTE 2 Test methods from BS EN 1728 are specified where appropriate.

NOTE 3 The requirements of this standard are intended to demonstrate the ability of the item to give satisfactory service in its intended environment. Conformity with the standard does not ensure that structural failure will not eventually occur as a result of habitual misuse or after an excessively long period of service.

#### 2 Normative references

The following normative document contains provisions which, through reference in this text, constitute provisions of this part of this British Standard. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. For undated references, the latest edition of the publication referred to applies.

BS EN 1728:2001, Domestic furniture — Seating — Test methods for the determination of strength and durability.

### 3 Principle of the performance tests

#### 3.1 General

Conformity with the requirements given in clause 4 for the strength and durability of the structure of an article of furniture is verified by applying to various parts, loads or forces simulating normal functional use, as well as acceptable misuse, according to a graded scale of severity (see Annex A).

The interrelation between the tests is shown in Table 1.

The test sequence as a whole determines the following:

- a) static strength and initial damage;
- b) fatigue strength and damage propagation;
- c) ability to withstand acceptable misuse; and demonstration of residual strength.

The magnitude of the forces applied or the number of applications varies according to the grade to which conformity is being tested.

Table 1 — Purpose of tests

Name of test	Primary purpose	Secondary purpose	Type of test
Seat static load	Basic strength	Damage initiation	Functional
Back static load			(normal use)
Arm and wing sideways static load	1		
Arm downwards static load			
Seat fatigue	Service durability	Damage propagation	
Back fatigue			
Leg forwards and sideways	Handling strength	Residual strength	Acceptable misuse
Static load			
Diagonal base			
Seat impact	Impact strength		
Back impact			
Arm impact			
Drop			

#### 3.2 Static tests

Static tests assess the static strength of the article under the highest levels of loading that can reasonably be expected to occur.

#### 3.3 Fatigue tests

The strength of the component parts of the article are tested by simulating the repeated application of loads and movement of components that occur during long-term use.

#### 3.4 Impact tests

Impact tests assess the impact strength of the article under the rapid rates of loading that occur only occasionally.

### 4 Requirements

- **4.1** After the seating has been tested in accordance with clause **5**, at the selected test level, none of the following shall have occurred:
  - a) any fracture of any member, joint or component, including seat suspensions and castors;
  - b) any fracture or cracking through the full thickness of any part of a structural shell;
  - c) any loosening, shown to be permanent by hand pressure applied to suitable members, of joints intended to be rigid;
  - d) any loosening, relative to the shell surface, of the underframe or base inserts moulded into a structural shell, shown to be permanent by means of hand pressure applied to the underframe or base;
  - e) any free movement in the back, arms, legs or other components of the article greater than that noted in the initial inspection (see 5.3);
  - f) any deformation or cracks that will adversely affect the appearance or strength of any part of the sample;
  - g) any impairment of the operation of any mechanical part;
  - h) the development of any clearly audible noise as a result of testing.
- **4.2** When the seating is tested in accordance with Annex B at the declared test level, the flexibility quotient (see Annex B) shall not exceed  $0.000 \ 8 \times F$ , where F is the applied back static force given in Table 2 (see Figure B.1).

Additionally for all-foam chairs, the distance measured in **B.5** shall not exceed 100 mm.

#### 5 Tests

NOTE For the purpose of these tests, pouffes are considered to be stools.

#### 5.1 Samples

All the tests shall be carried out on the same sample. If any failure occurs during the sequence of tests, all the tests shall be repeated on a completely new test sample.

NOTE The test results are valid only for the article tested. When the test results are intended to cover other similar articles, the test specimen should be representative of the production model. Information on the scale of sampling to be employed can be obtained from BS 6001.

#### 5.2 Moisture content of timber components

Before testing, parts made of timber products shall be checked with an electric moisture meter to ensure that the moisture content is between 8 % and 12 %. If the moisture content is higher than 12 %, the sample shall be allowed to dry out in a warm ventilated room until the moisture content is between 8 % and 12 %.

#### 5.3 Inspection before testing

Immediately before testing, the sample shall be thoroughly inspected. Any defects in the members, joints or attachments shall be noted so that they are not attributed to the tests. A complete dimensional check shall be carried out on all articles likely to suffer permanent deformation as a result of testing. The dimensions shall be recorded.

Any minor defects detected as a result of this inspection shall be recorded in the test report. If the sample is found to have a major defect as described in 4.1, the sample shall be rejected.

#### 5.4 Procedure

The sample shall be tested in accordance with BS EN 1728:2001 and with Annex B and Annex C of this standard, as specified in Table 2. All tests shall be carried out at the same test level (see Table 2), and in the sequence given in Table 2.

#### 5.5 Inspection after testing

Immediately after completion of the tests, the sample shall again be thoroughly inspected. Any apparent defects as given in 4.1 shall be noted, together with any other changes that have taken place since the initial inspection.

Table 2 — Tests

Test description	Loading			Test level			
Test description		1	2	3	4	5	
Seat static load	Force, N: 10 times  -		1200	1300	1600	2000	
Back static load	Force, N: 10 times		410	450	550	700	
Flexibility assessment	Measurement made after back static load test (BS EN 1728:2001, <b>6.2</b> )				t		
Additional static load	See BS EN 1728:200	1, <b>6.3</b>

	1 * ' *						
Drop test for single-seat units (including stacking chairs)	Nominal drop height, mm: 10 times	100			300	450	
Drop test for multi-seat units	Nominal drop height, mm: 5 times on each end		150	200	300	450	
	Back static load Flexibility assessment Additional static load Foot rail static Arm sideways static load Wing sideways static load Arm downwards static load Seat fatigue Back fatigue Back fatigue Additional seat and back fatigue Leg-rest fatigue Leg forward static load Balancing seat load Leg sideways static load Balancing seat load Diagonal base load Seat impact test  Back impact test  Drop test for single-seat units (including stacking chairs) Drop test for multi-seat units	Seat static load Back static load Force, N: 10 times Flexibility assessment Flexibility assessment Measurement made a (BS EN 1728:200), 6 Additional static load Foot rail static Force, N: 10 times Force, N: 10 times Force, N: 10 times India force, N: 10 times Force, N: 10 times India force, N: 1	Seat static load	1   2   1200	1	1	

<sup>Subclause number of BS EN 1728:2001, unless otherwise stated.
Annex of this standard, BS 4875-1:2001
One cycle consists of the application of the load once on each side of the seat.</sup> 

## 6 Test report

The test report shall include the following:

- a) the number and date of this British Standard, i.e. BS 4875-1:2001;
- b) details of the article tested, e.g. specification and photographs;
- c) the test level at which the article has been tested;
- d) details of any defects observed before the tests;
- e) details of any defects and damage observed after the tests;
- f) if appropriate:
  - 1) the flexibility quotient (see 4.2 and Annex B);
  - 2) details of any damage which does not impair the function of the article;
- g) for all-foam chairs, the back deflection in millimetres;
- h) the test result;
- i) details of any deviation from the test procedures;
- j) for articles which have adjustable components, the tightness and positioning of the adjustment used during testing.

# Annex A (informative) Test levels in relation to application

Table A.1 shows the type of use that might be expected from furniture in relation to the five test levels.

Table A.1 — Relationship of test levels to use of furniture

Test level	Performance category		Example of use		
1	Delicate		Seats of delicate appearance		
2	Careful domestic		Domestic bedroom		
3	General domestic	Careful contract	Domestic living/dining room, hotel bedroom		
4	Severe domestic	General contract	Seating where rough treatment and careless handling occur, e.g. college study, hotel reception area		
5		Severe contract	Seating intended for exceptionally severe use, e.g. transport terminus, student common room, barrack room		

Table A.2 shows the test levels appropriate to some typical applications.

Table A.2 — Test levels for typical applications

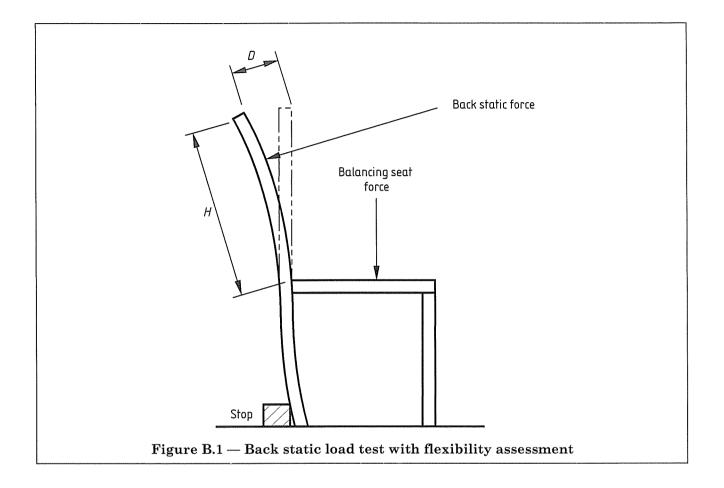

Type of use	Test level					
	1	2	3	4	5	
Garden and camping (folding furniture)	· · · · · · · · · · · · · · · · · · ·	X	X			
Domestic	X	X	X	X		
Institutional					X	
Hotel			X	X		
Non-specialized hospital				X	X	
Military					X	
Bar				X	X	
Church			X			
Police station				X	X	
Recreation room					X	
Common room					X	
Public hall				X	X	

## Annex B (normative) Flexibility assessment

NOTE This assessment of flexibility is made at the final stage of the back static load test given in BS EN 1728:2001, 6.2. This ensures that any plasticization of plastics components has been taken into account

- **B.1** When the back static load test from BS EN 1728:2001, **6.2** is applied to an article fitted with a spring rocking action base that has a tension adjustment, increase the tension so that the least possible rocking movement is obtained during the test.
- **B.2** If it is not possible to apply the back force at the back loading point due to the construction of the article, e.g. if the back is constructed of cross-members positioned above and/or below the back loading point, use a suitable panel to spread the load over the back cross-members, ensuring that the panel used does not overlap the side upright members of the article.
- **B.3** Perform the back static load test as specified in BS EN 1728:2001, **6.2**, using the appropriate back force specified in Table 2. On the tenth application of the back force, measure the deflection, D, of the top of the back from the unloaded position (see Figure B.1).
- **B.4** Calculate the flexibility quotient D/H, where H is the distance from the seat surface to the top of the back (see Figure B.1).
- **B.5** Additionally for all-foam chairs, record the position of the front face of the seat loading pad when it is just in contact with the back. Apply the back force (see Table 2) once again and maintain it for 5 min or until creep movement has stopped, whichever is the longer. Then measure the distance, in millimetres, between the face of the loading pad whilst the load is applied, and the surface of the back when unloaded (i.e. the position of the loading pad determined before applying the force).

NOTE All-foam chairs are composed essentially of flexible cellular material. Internal or external reinforcement or stiffening is sometimes incorporated, but this does not function as a frame, i.e. loads applied are transmitted to the floor or base platform by the flexible foam, and not by structural components or other material. All-foam chairs are subject to creep, i.e. slow distortion under sustained load. Therefore while support may be adequate immediately on sitting down, it is likely to be reduced after a period of sitting.

# Annex C (normative) Drop test for single-seat units

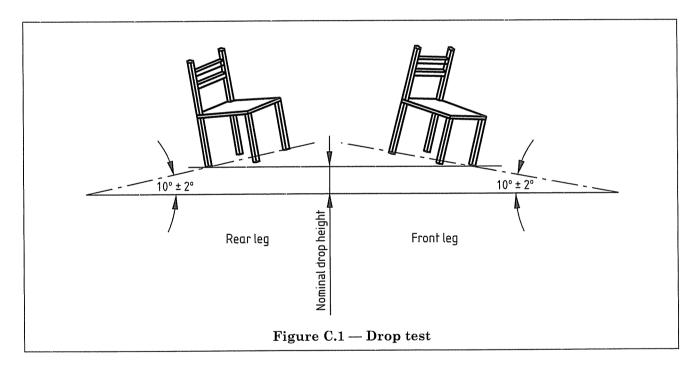

C.1 Support the sample so that one foot is just in contact with the floor, whilst the line joining that foot to the foot diagonally opposite is inclined at  $10^{\circ} \pm 2^{\circ}$  to the horizontal and the line joining the remaining feet is horizontal (see Figure C.1). In the case of three-legged stools, support the stool so that the line joining two feet is horizontal and the line from the third foot, i.e. the one receiving impact, to the mid-point of the line joining the other two feet is inclined upwards at  $10^{\circ} \pm 2^{\circ}$  to the horizontal. For chairs having five-star bases, use the nearest diagonally opposite foot.

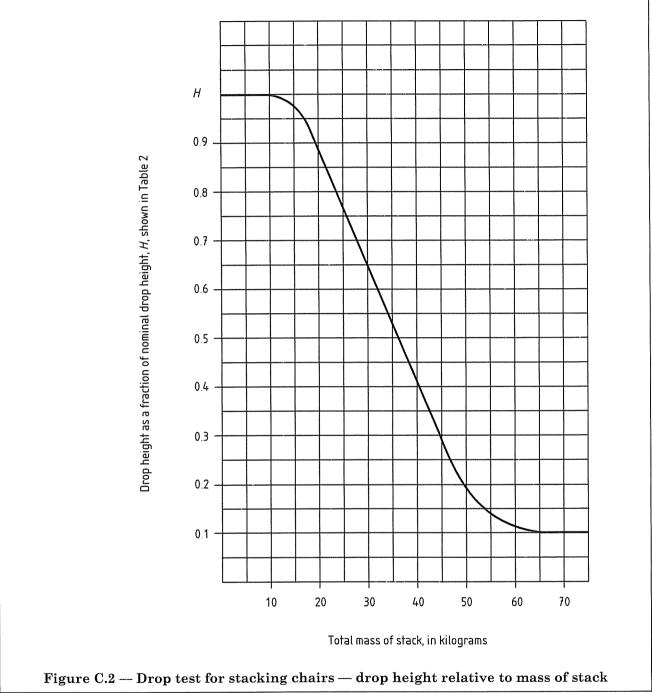

C.2 Lift up the sample to the nominal drop height specified in Table 2 for the appropriate test level (with a tolerance of  $\pm 1.0$  mm), as indicated in Figure C.1, maintaining the orientation specified in C.1.

NOTE Positioning for the drop may be achieved by lifting the sample by three cords that are adjusted in length while the sample stands in the correct orientation on a plane inclined at 10° from the horizontal.

Drop the sample on to the floor 10 times so that a front leg takes the initial impact, and a further 10 times so that a rear leg takes the impact; or, in the case of three-legged articles, so that two separate legs in turn take the impact.

C.3 Stacking chairs shall be dropped as described in C.1 and C.2, but in a stack of six chairs, using the drop height calculated in accordance with Figure C.2 in relation to the total mass of the stack and the appropriate nominal drop height specified in Table 2.

# Bibliography

### Standards publications

BS 5459-2:2000, Specification for performance requirements and tests for office furniture —  $Part\ 2$ : Office pedestal seating for use by persons weighing up to 150 kg and for use up to 24 hours a day, including type-approval tests for individual components.

 $BS\ 6001$  (all parts),  $Sampling\ procedures$  for inspection by attributes.

# BSI — British Standards Institution

BSI is the independent national body responsible for preparing British Standards. It presents the UK view on standards in Europe and at the international level. It is incorporated by Royal Charter.

#### Revisions

British Standards are updated by amendment or revision. Users of British Standards should make sure that they possess the latest amendments or editions.

It is the constant aim of BSI to improve the quality of our products and services. We would be grateful if anyone finding an inaccuracy or ambiguity while using this British Standard would inform the Secretary of the technical committee responsible, the identity of which can be found on the inside front cover. Tel: 020 8996 9000. Fax: 020 8996 7400.

BSI offers members an individual updating service called PLUS which ensures that subscribers automatically receive the latest editions of standards.

#### **Buying standards**

Orders for all BSI, international and foreign standards publications should be addressed to Customer Services. Tel: 020 8996 9001. Fax: 020 8996 7001. Standards are also available from the BSI website at <a href="http://www.bsi-global.com">http://www.bsi-global.com</a>.

In response to orders for international standards, it is BSI policy to supply the BSI implementation of those that have been published as British Standards, unless otherwise requested.

#### Information on standards

BSI provides a wide range of information on national, European and international standards through its Library and its Technical Help to Exporters Service. Various BSI electronic information services are also available which give details on all its products and services. Contact the Information Centre. Tel: 020 8996 7111. Fax: 020 8996 7048.

Subscribing members of BSI are kept up to date with standards developments and receive substantial discounts on the purchase price of standards. For details of these and other benefits contact Membership Administration. Tel: 020 8996 7002. Fax: 020 8996 7001. Further information about BSI is available on the BSI website at <a href="http://www.bsi-global.com">http://www.bsi-global.com</a>.

#### Copyright

Copyright subsists in all BSI publications. BSI also holds the copyright, in the UK, of the publications of the international standardization bodies. Except as permitted under the Copyright, Designs and Patents Act 1988 no extract may be reproduced, stored in a retrieval system or transmitted in any form or by any means — electronic, photocopying, recording or otherwise — without prior written permission from BSI.

This does not preclude the free use, in the course of implementing the standard, of necessary details such as symbols, and size, type or grade designations. If these details are to be used for any other purpose than implementation then the prior written permission of BSI must be obtained.

If permission is granted, the terms may include royalty payments or a licensing agreement. Details and advice can be obtained from the Copyright Manager. Tel: 020 8996 7070.
