

Low-Power CMOS Ionization Smoke Detector IC with Interconnect and Temporal Horn Driver

The MC145018, when used with an ionization chamber and a small number of external components, will detect smoke. When smoke is sensed, an alarm is sounded via an external piezoelectric transducer and internal drivers. This circuit is designed to operate in smoke detector systems that comply with UL217 and UL268 specifications.

Features

- Ionization Type with On-Chip FET Input Comparator
- Piezoelectric Horn Driver
- Guard Outputs on Both Sides of Detect Input
- Input-Protection Diodes on the Detect Input
- Low-Battery Trip Point, Internally Set, can be Altered Via External Resistor
- Detect Threshold, Internally Set, can be Altered Via External Resistor
- Pulse Testing for Low Battery Uses LED for Battery Loading
- Comparator Output for Detect
- Internal Reverse Battery Protection
- Strobe Output for External Trim Resistors
- I/O Pin Allows Up to 40 Units to be Connected for Common Signaling
- Supports NFPA 72, ANSi 53.41, and ISO 8201 Audible Emergency Evacuation Signals
- Power-On Reset Places IC in Standby Mode

Table 1. Maximum Ratings⁽¹⁾
(Voltages referenced to V_{SS})

Rating	Symbol	Value	Unit
DC Supply Voltage	V_{DD}	-0.5 to + 15	V
Input Voltage, All Inputs Except Pin 8	V_{in}	-0.25 to $V_{DD} + 0.25$	V
DC Current Drain per Input Pin, Except Pin 15 = 1 mA	I	10	mA
DC Current Drain per Output Pin	I	30	mA
Operating Temperature Range	T_A	-10 to + 60	°C
Storage Temperature Range	T_{stg}	-55 to + 125	°C
Reverse Battery Time	t_{RB}	5.0	s

1. Maximum Ratings are those values beyond which damage to the device may occur.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that V_{in} and V_{out} be constrained to the range $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$.

Table 2. Recommended Operating Conditions(Voltages referenced to V_{SS})

Parameter	Symbol	Value	Unit
Supply Voltage	V_{DD}	9.0	V
Timing Capacitor	—	0.1	μF
Timing Resistor	—	8.2	$\text{M}\Omega$
Battery Load (Resistor or LED)	—	10	mA

Table 3. Electrical Characteristics(Voltages referenced to V_{SS} , $T_A = 25^\circ\text{C}$)

Characteristic	Symbol	V_{DD} V_{DC}	Min	Typ ⁽¹⁾	Max	Unit
Operating Voltage	V_{DD}	—	6.0	—	12	V
Output Voltage	V_{OH}	7.2	6.3	—	—	V
Piezoelectric Horn Drivers ($I_{OH} = -16\text{ mA}$)		9.0	8.5	8.8	—

DEVICE OPERATION

Timing

The internal oscillator of the MC145018 operates with a period of 1.65 seconds during no-smoke conditions. Each 1.65 seconds, internal power is applied to the entire IC and a check is made for smoke, except during LED pulse, Low Battery Alarm Chirp, or Horn Modulation (in smoke). Every 24 clock cycles a check is made for low battery by comparing

V_{DD} to an internal zener voltage. Since very small currents are used in the oscillator, the oscillator capacitor should be of a low leakage type.

Detect Circuitry

If smoke is detected, the oscillator period becomes 41.67 ms and the piezoelectric horn oscillator circuit is

enabled. The horn output is modulated 500 ms on, 500 ms off. During the off time, smoke is again checked and will inhibit further horn output if no smoke is sensed. During local smoke conditions the low battery alarm is inhibited, but the LED pulses at a 1.0 Hz rate. In remote smoke, the LED is inhibited as well.

An active guard is provided on both pins adjacent to the detect input. The voltage at these pins will be within 100 mV of the input signal. This will keep surface leakage currents to a minimum and provide a method of measuring the input voltage without loading the ionization chamber. The active guard op amp is not power strobed and thus gives constant protection from surface leakage currents. Pin 15 (the Detect input) has internal diode protection against static damage.

Interconnect

The I/O (Pin 2), in combination with V_{SS} , is used to interconnect up to 40 remote units for common signaling. A Local Smoke condition activates a current limited output driver, thereby signaling Remote Smoke to interconnected units. A small current sink improves noise immunity during non-smoke conditions. Remote units at lower voltages do not draw excessive current from a sending unit at a higher voltage. The I/O is disabled for three oscillator cycles after power up, to eliminate false alarming of remote units when the battery is changed.

Sensitivity/Low Battery Thresholds

Both the sensitivity threshold and the low battery voltage levels are set internally by a common voltage divider (see

Figure 2) connected between V_{DD} and V_{SS} . These voltages can be altered by external resistors connected from pins 3 or 13 to either V_{DD} or V_{SS} . There will be a slight interaction here due to the common voltage divider network. The sensitivity threshold can also be be set by adjusting the smoke chamber ionization source.

Test Mode

Since the internal op amps and comparators are power strobed, adjustments for sensitivity or low battery level could be difficult and/or time-consuming. By forcing Pin 12 to V_{SS} , the power strobing is bypassed and the output, Pin 1, constantly shows smoke/no smoke. Pin 1 = V_{DD} for smoke. In this mode and during the 10 ms power strobe, chip current rises to approximately 50 μA .

LED Pulse

The 9-volt battery level is checked every 40 seconds during the LED pulse. The battery is loaded via a 10 mA pulse for 11.6 ms. If the LED is not used, it should be replaced with an equivalent resistor such that the battery loading remains at 10 mA.

Hysteresis

When smoke is detected, the resistor/divider network that sets sensitivity is altered to increase sensitivity. This yields approximately 100 mV of hysteresis and reduces false triggering.

Figure 6. Typical Application as Ionization Smoke Detector

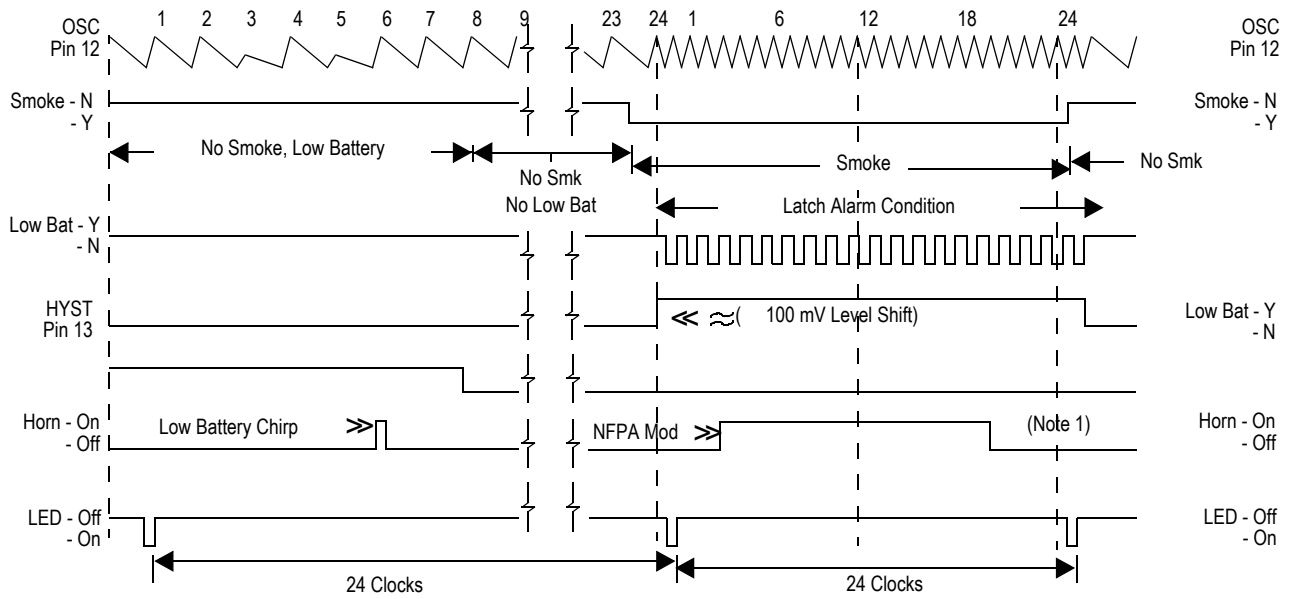

Figure 7. MC145017 Timing Diagram

NOTE:

1. Horn modulation is self-completing. When going from smoke to no smoke, the alarm condition will terminate only when horn is off.
Comparators are strobed once per cycle (1.65 sec for no smoke, 40 msec for smoke).
For timing under remote conditions, refer to MC14468 data sheet.
