Introduction

This manual details the communication structure and commands used to send programming parameters to the ICR803. To get started please refer to the manual named "ICR803 QUICK START GUIDE".

Serial Programming

The serial programming commands may be used in place of the programming bar codes. Both the serial commands and the programming bar codes will configure the ICR803.

Conventions

The following conventions are used for menu and query command descriptions.

Parameter	A label representing the actual
[option]	An optional part of the command
{data}	Alternatives in a command
Bold	Names of menus, menu commands, buttons, dialog boxes, and windows that appear on the screen.

Menu Command Syntax

Menu commands have the following syntax (spaces have been used for clarity only):

Prefix Tag SubTag {Data} [,SubTag { Data}][; Tag SubTag {Data}][...] Storage

Prefix	Three ASCII characters: SYN M CR (ASCII 22,77,13)
Tag	Three character case-insensitive field that identifies the desired menu command group. For example, all RS232 configuration settings are identified with a Tag of 232.
SubTag	Three character case-insensitive field that identifies the desired menu command within the tag group. For example, the SubTag for the RS232 baud rate is BAD .
Data	The new value for a menu setting, identified by the Tag and SubTag.
Storage	A single character that specifies the storage table to which the command is applied. An exclamation point (!) performs the command's operation on the devices volatile menu configuration table. A period (.) performs the command's operation on the devices non-volatile menu configuration table. Use the non-volatile table only for semi-permanent changes you want saved through a power cycle.

Query Commands

Several special characters can be used to query the device about its settings.

^	What is the default value for the setting(s).
?	What is the devices current value for the setting(s).
*	What is the range of possible values for the setting(s). The devices response uses a dash (-) to indicate a continuous range of values. A pipe () separates items in a list of non-continuous values.

Tag Field Usage

When a query is used in place of a Tag field, the query applies to the entire set of commands available for the particular storage table indicated by the storate field of the command. In this case, the SubTag and Data fields should not be used because they're ignored.

SubTag Field Usage

When a query is used in place of a SubTag field, the query applies only to the subset of commands available that match the Tag field. In this case, the Data field should not be used because it is ignored.

Data Field Usage

When a query is used in place of the Data field, the query applies only to the specific command identified by the Tag and SubTag fields.

Concatenation of Multiple Commands

Multiple commands can be issued within one Prefix/Storage sequence. Only the Tag, SubTag, and Data fields must be repeated for each command in the sequence. If additional commands are to be applied to the same Tag, then the new command sequence is separated with a comma (,) and only the SubTag and Data fields of the additional command are issued. If the additional command requires a different Tag field, the command is separated from the previous commands by a semicolon (;).

Responses

The device responds to the serial commands with one of three responses:

ACK	Indicates a good command has been processed.
ENQ	Indicates an invalid Tag or SubTag command
NAK	Indicates the command was good, but the Data field entry was out of the allowable range for this Tag and SubTag combination, e.g., an entry for a minimum message length of 100 when the field will only accept 2 characters.

When responding, the device echoes back the command sequence with the status character inserted directly before each of the punctuation marks (the period, exclamation point, comma, or semicolon) in the command.

Examples of Query Commands

	Description	Command	Response
A	This query requests the range of possible values for Codabar Coding Enable.	cbrena* .	CBRENA0-1[ACK] This response indicates possible values are 0 (for Off) and 1 (for On).
B	This query requests the default setting for Codabar enable.	cbrena^.	CBRENA1[ACK] This response indicates the default value is 1 (or On).
C	What is the device's current setting for Corabar Coding	cbrena?.	CBRENA1[ACK] This response indicates that codabar coding is 1 (i.e. On).
D	What are the device's settings for all codabar selections?	cbr?.	CBRENA1[ACK], SSX0[ACK], CK20[ACK], CCT1[ACK], MIN2[ACK], MAX60[ACK], DFT[ACK]. This response indicates the following: 1. Codabar coding (CBRENA) is enabled 2. Start/Stop character (SSX) is disabled 3. Check character (CK2) is disabled 4. Check character (CCT) is enabled 5. Min Message Length (MIN) is 2 characters. 6. Max Message Length (MAX) is 60 characters.

Trigger Commands

You can activate and deactivate the imager with serial trigger commands. First, the imager must be put in Manual/Serial Trigger Mode either by scanning the Manual/Serial Trigger Mode bar code, or by sending the Manual/Serial Menu Command. Once the imager is in serial trigger mode, the trigger is activated and deactivated by sending the following commands:

Activate Serial Trigger	SYN T CR
Deactivate Serial Trigger	SYN U CR

When the Trigger Command is activated, the imager scans until a bar code has been read, until the deactivated command is sent, or until the serial time out has been reached.

Resetting the Standard Product Defaults

If you aren't sure what programming options are in your imager, or you've changed some options and want the factory settings restored, scan the Standard Product Default Settings bar code below.

DEFALT.

Menu Commands

Selection	Setting (* indicates default)	Serial Command	Description
