

J22 and J23 Detector Operating Notes (0.8 to 2.6 μm)

General

The J22 and J23 series are high performance InGaAs detectors operating over the spectral range from 0.8 μm to 2.6 μm . These detectors provide fast rise time, uniformity of response, excellent sensitivity, and long term reliability for a wide range of applications. For enhanced performance or temperature stability of response near the cutoff wavelength, Judson offers a variety of thermoelectrically cooled detector options.

Device Options

Judson's standard InGaAs detectors, the J22 series, offers high reliability and performance in the spectral range from 0.8 μm to 1.7 μm . In addition, the J23 series extended InGaAs detectors are available in four cutoff options at 1.9 μm , 2.2 μm , 2.4 μm and 2.6 μm . Figure 1 shows the typical response for the J22 and J23 series at room temperature operation.

Package Options

The J22 and J23 series are available in standard TO packages, ceramic sub-mounts, and bare die. We also offer different window materials, lenses or optical filter options. Please refer to pages 6 and 7 for package drawing examples.

For more demanding applications, Judson's team of engineers will provide custom design services. Please contact us with your special requirements

Accessories

For a complete system, Judson offers low noise transimpedance amplifier modules, heat sink/preamp assemblies and temperature controllers. For further details, please visit our website.

Call us

Let our team of application engineers assist you in selecting the best detector design for your application. Or visit our website for additional information on all of Judson's products.

Applications

- Gas analysis
- NIR-FTIR
- Raman spectroscopy
- IR fluorescence
- Blood analysis
- Optical sorting
- Radiometry
- Chemical detection
- Optical communication
- Optical power monitoring
- Laser diode monitoring
- Laser burn-in

InGaAs Arrays Parallel Output NIR Arrays (0.8 to 1.8 μm)

Description

Standard packaging and element configurations result in low cost and quick delivery for Judson's high-quality photodiode arrays.

The 16 and 32 element InGaAs arrays respond to infrared radiation from 700nm to 1.8 μm . The photodiode arrays come mounted in a dual inline 40 pin package.

Judson's NIR arrays have a parallel output format with common substrate and one pinout for each element. This format allows for independent readings from each channel.

A separate transimpedance op-amp circuit is recommended for each channel. The Judson Model PA-7:16C and PA-7:32C preamps are convenient multi-channel modules with receptacles for the array package. Transimpedance gain is specified by the user.

Applications

- Clinical Analyzers
- Near-IR Spectroscopy for Analysis of:
 - Protein
 - Blood Samples
 - Agricultural Products
- Fiber Optics:
 - Far-Field Laser Diode Pattern Analysis
 - Infrared Fiber Testing
- Currency Validation

Package

These arrays are mounted in the Judson "40P" package, a 40 pin, dual-in-line package with glass window (Fig. 9-1).

Pins 1 and 21 are connected to the common substrate. Elements of the 16-element array are connected to pins 23-38. The 32-element array is mounted with odd-numbered elements connected to pins 3-18 and even-numbered elements connected to pins 23-38.

The gap between elements is 0.01mm.

Figure 9-1
