

CHCS-ITH-3000S 系列高精度电流传感器 CHCS-ITH-3000S series ultra high precision current sensor

产品介绍 Product introduction

用于电流的超高精度测量：DC，AC，脉冲……，初级和次级之间采用电流隔离。

For ultra-high precision measurement of current: DC, AC, pulsed..., with galvanic separation between primary and secondary.

Current transducer uses Fluxgate principle to measure any kinds of electric current. The output signal is small current that can be accepted by electronic circuit. The primary input current and the secondary output signal is highly electric isolated. This kind of transducer has a compact size but with a big hole aperture.

- ★ AC/DC/Pulsed and Mixed current
- ★ High accuracy
- ★ Optimized response time
- ★ Very good linearity
- ★ High immunity to external interference
- ★ Wide frequency bandwidth
- ★ Very low temperature drift

1. 测试说明 Test instructions:

通过测量流过 R_M 的测试电流 I_s , 或者 R_M 两端的电压 U_R , 可以得到原边电流 I_P :

By measuring the test current I_s flowing through the R_M , or the voltage U_R at both ends of the R_M , the original side current I_P can be obtained:

$$I_P = K_N * I_s = K_N * (U_R / R_M)$$

2. 指示灯和指示信号说明 Indication lights and indication signals:

在正常工作情况下, 有效指示灯处于常亮状态。如果指示灯熄灭, 说明电流量传感器处于非零磁通状态, 如母线电流超过量程等。此时, 传感器内部进入扫描状态, 输出电流不再与输入电流信号等比例, 一旦母线电流回落到量程之内, 传感器即恢复正常工作。有效指示信号与指示灯是同一信号驱动的, 它为 OD 门输出形式, 有效时输出对应为低电平。

Under normal working condition, the effective indicating lamp is working. If the indicator lights out, It indicates that the current sensor is in a non zero flux state, for example, bus current exceeds range. At this time, the sensor enters the scanning state, and the output current is no longer proportional to the input current signal. Once the bus current falls back within the range, the sensor will resume normal operation. The valid indicator signal and the indicator lamp are driven by the same signal. It is the output form of OD gate. When valid, the output corresponds to the low level.
